

```
function zoo() {
    // Local variables of Zoo
    var tiger = "zinda hai";
    var lion = "zaroor marega";

    function cage() {
        // Using variables from outer scope
        // Will be "captured" in a closure
        console.log("tiger", tiger);
    }

    // local variables tiger and lion
    // will be destroyed here
    return cage;
}

// We get reference to inner function
var pinjara = zoo();

// Which we call and tiger is in the closure
pinjara();
```
